

Installing Netbeans and completing the tutorial was a breeze. I think the tutorial took me about five minutes. I had a slight issue with creating the project as *stackdogarray* with the initial class named the same, so when I tried to implement the actual *stackdogarray* class I ran into a naming convention. After renaming the proper class to *Main*, the only real issue I had was figuring out what was causing a parsing error. It was because there was a `}` missing at the end of *Main*. In total I think I spent maybe ten minutes getting the program to run correctly.
